	Topic:	HYDROFILL™	Series:	NA5709 Series

Caleffi North America is introducing a unique and innovative water treatment product used for filling hydronic systems.

HYDROFILL™ is a water treatment product that produces, from site-sourced water, demineralized water of an ideal and consistent quality for filling closed hydronic heating and cooling systems.

The HYDROFILL™ removes salts and other soluble minerals found in local water supplies. These “hard water” minerals can lead to lime scale formation and cause premature equipment failure and reduced efficiency of heat exchangers. The treated water also has reduced electrical conductivity to minimize galvanic corrosion.

NA570924

NA570912

The HYDROFILL™ filling units have an integral battery-powered Total Dissolved Solids (TDS) meter, at the outlet of the unit, which indicates treated water condition in Parts per Million (PPM). When the meter reading reaches 30 PPM it's time to replace the resin bags. A four-bag HYDROFILL™ can treat up to 3750 gallons (depending on water hardness) before the bags need to be replaced. Standard garden hoses connect the site-water to the bottom inlet port and the top outlet to the system fill valve.

The HYDROFILL™ product family consists of these Code numbers:

- 1) NA570912: Water treatment filling unit with two disposable resin filter bags
- 2) NA570924: Water treatment filling unit with cart and four disposable resin filter bags
- 3) NA570971: Two replacement resin filter bags
- 4) NA570974: Four replacement resin filter bags
- 5) NA573022: Demineralizer AutoFill assembly for permanent installation on feed water line
- 6) NA573102: Demineralizer AutoFill assembly replacement cartridge
- 7) NA575002: pH and TDS water quality test kit

The HYDROFILL™ products from Caleffi are available now, and in stock in Milwaukee.
